

HOUSEHOLD INVESTMENT & RETIREMENT STRATEGY

Chief Investment Officer review for Peter and Abigail

Financial data as at 29 July 2026

Monthly budget updated 11 July 2026

Scope: liquidity, asset allocation, product overlap, risk controls, property decision framework, retirement readiness, insurance and estate priorities.

Core conclusion

You are in a strong accumulation position, but you are not yet financially independent. The portfolio does not need more risk. It needs less complexity, firmer liquidity rules, disciplined protection planning and a property decision that does not cannibalise retirement.

CIO ASSESSMENT

Executive verdict

S\$371.5k Financial assets	74% Growth assets	41% Annualised take-home saved/invested	~S\$1.01m Estimated family balance sheet*
--	---	---	---

My blunt professional view

You are doing well, but the next mistake matters more than the next winning stock. At roughly age 35, you have built a strong base and an assertive 74% growth allocation. The current portfolio is not too conservative. The main threats are fee-heavy overlap, using Cash+ simultaneously as emergency money and investment fuel, under-specified family protection, and stretching for a second property before the dedicated capital is ready.

1. Strong, not independent	Your wider family balance sheet is around S\$1.0m on an approximate basis, but only S\$31.7k is cash-like and S\$235.3k is readily redeemable. Wealth on paper is not the same as financial independence.
2. Risk is already high enough	About 74% of financial assets are equities or REITs. Divesting Income+ to buy more equity would solve no actual problem.
3. Complexity is the hidden leak	Core Equity100, two S&P; 500 SRS accounts, two AIA Adventurous policies, Equity Alpha, SPY and direct US stocks repeatedly own similar mega-cap companies.
4. Property is the swing decision	A second property could work, but it is the one decision capable of reducing liquidity, increasing leverage and delaying retirement at the same time.
5. Age 55 is not funded yet	At the current retirement contribution rate, a S\$7,000/month lifestyle in today's dollars is not supported by the private portfolio at age 55. Age 60 is plausible with consistent bonus saving; age 65 looks robust before CPF.
6. Protection must be audited	The investment system is detailed; the death, TPD, disability-income, will, guardianship, CPF nomination and LPA plan is not yet equally explicit.

*Includes approximate home equity, CPF balances and children's funds supplied previously. It is not an audited net-worth statement.

BALANCE SHEET

What you own - consolidated household view

Account / product	Current value	Weight	Portfolio role
Core Equity100	S\$87,292.89	23.5%	Global equity core
Income+ Enhance	S\$58,311.93	15.7%	Fixed-income stabiliser
SRS - Peter (S&P; 500)	S\$40,000.00	10.8%	Restricted US equity
AIA - Abigail (Pro Achiever 3.0)	S\$38,345.43	10.3%	Restricted 90/10 global portfolio
Cash+ Flexi	S\$31,732.70	8.5%	Cash-like / staging
AIA - Peter (Pro Achiever 2.0)	S\$29,831.78	8.0%	Restricted 90/10 global portfolio
SRS - Abigail (S&P; 500)	S\$28,000.00	7.5%	Restricted US equity
REIT+	S\$26,493.96	7.1%	Singapore REIT satellite
Syfe Trade	S\$16,821.45	4.5%	Active stock satellite
GE Smart Invest (China)	S\$13,443.65	3.6%	Liquid China equity satellite
Equity Alpha	S\$1,239.25	0.3%	Active equity satellite
TOTAL FINANCIAL ASSETS	S\$371,513.04	100.0%	

Broader family balance sheet - approximate

Component	Value	Treatment
Financial assets shown above	S\$371,513	Current values from screenshots
Estimated CPF balances	~S\$262,000	Approximate; update from latest CPF statements
Estimated home equity	~S\$350,000	S\$600k property less S\$250k mortgage
Children's education funds	~S\$24,000	Ring-fenced; not retirement capital
Estimated family balance sheet	~S\$1,007,513	Before any undisclosed liabilities

Do not confuse account value with spending capacity

Only S\$31,733 is cash-like. Another S\$203,603 is accessible but market-exposed. About S\$136,177 (36.7%) is committed inside SRS or AIA structures. This distinction matters for emergencies, property and early retirement.

ASSET ALLOCATION

Portfolio construction is already broadly right

Current versus strategic band

Asset class	Current	Strategic band	Decision
Equities	66.8%	65-70%	Inside band
REITs	7.1%	5-8%	Inside band
Fixed income	17.5%	15-20%	Inside band
Cash-like	8.5%	8-10%	Inside band

Decision: no major asset-class rebalance. Keep Income+; do not raise overall equity risk. Rebalance through new cash flows rather than selling unless a band is breached by more than 5 percentage points.

The real concentration is hidden in wrappers

Core Equity100, SRS S&P; 500, AIA Elite Adventurous, Equity Alpha, SPY and direct US shares repeatedly expose you to the same US mega-cap earnings cycle. Account count is not diversification. Look-through exposure is what matters.

HOUSEHOLD OPERATING SYSTEM

Cash flow is strong - liquidity rules need tightening

S\$9,900 Monthly take-home	S\$48,920 Known annual wealth building	41.2% Of take-home	4.9 months Cash+ vs non-investment allocations
--------------------------------------	--	------------------------------	--

What is working

- Salary savings of S\$2,335/month feed Cash+.
- S\$500/week automatically moves from Cash+ into equity portfolios.
- Bonuses and large inflows enter Cash+ first, reducing impulsive market timing.
- The S\$700/month home fund is a separate long-term property goal.

Accounting correction

The two AIA policies require S\$12,500 per year, but Nest records S\$350/month. The remaining S\$8,300 appears to be bonus-funded. Nest should accrue the full contractual commitment so annual savings are not overstated.

Operational rule: salary savings fund the normal DCA; bonuses refill Cash+ and annual commitments before discretionary stock purchases.

Recommended liquidity policy

Layer	Target / trigger	Rule
Immediate bank cash	S\$10k-S\$15k	One to two months of bills; same-day access
Cash+ emergency floor	S\$35k-S\$40k total	Do not invest below this floor
Above the floor	Continue DCA	Use bonuses for additions or goals
Below S\$35k	Cut Equity Alpha first	Keep Core and contractual AIA commitments
Below S\$30k	Pause discretionary DCA	Rebuild liquidity before adding risk

Hard truth: Cash+ is not a bank account

Cash+ Flexi is liquid, but it is an investment portfolio rather than a guaranteed bank deposit. Keep a same-day bank buffer, then use Cash+ as the second liquidity layer and investment reservoir. [9]

HARD TRUTHS

The biggest leak is complexity, not performance chasing

AIA: committed, expensive, already large

The two policies are S\$68,177 or 18.4% of financial assets and require S\$12,500 annually. AIA classifies Elite Adventurous as higher risk, approximately 90% equities / 10% fixed income, with a 1.45% management fee and 1.50% 2025 expense ratio. Its published five-year annualised return to 31 Dec 2025 was 5.50% versus 10.29% for its benchmark, before policy-level charges. [2][3]

SRS: tax-efficient but US-heavy

Both SRS portfolios hold the S&P; 500, totalling S\$68,000. The wrapper is useful; the underlying allocation is concentrated. Future SRS contributions should diversify globally unless you deliberately want a structural US overweight. Qualifying retirement withdrawals receive 50% taxability, but early withdrawals are generally fully taxable and penalised. [7]

Equity Alpha: trial, not core

A 50:50 split of new Syfe equity contributions gives a new active strategy the same cash flow as your established core. That is backwards. Active strategies must earn the right to grow through measured net-of-fee outperformance.

Income+: keep it, understand it

At 15.7% of the portfolio, Income+ is a stabiliser, not dead money. Reinvest distributions unless needed. A positive payout does not necessarily mean positive total return, and distributions can come from capital. [9]

Brokerage: acceptable as a satellite

Syfe Trade is only 4.5% of financial assets. Its Apple and other single-stock concentrations look large inside the account but remain manageable at household level. The mistake would be allowing this sleeve to expand without a cap.

Policy from now on

No new ILPs. No top-ups to existing AIA policies. Keep the contracts because that is your chosen long-term commitment, but compare the underlying fund against its benchmark annually and ask AIA whether a lower-cost index-oriented internal fund switch is available without restarting policy charges. Confirm all switching costs before acting.

INVESTMENT POLICY STATEMENT

Give every account one job

Account	Mandate	Operating rule
Cash+ Flexi	Liquidity and staging	Maintain floor; bonuses enter here; deploy by rule
Core Equity100	Primary liquid equity engine	Receive 75-80% of weekly equity DCA
Equity Alpha	Active satellite / experiment	Receive 20-25% of weekly equity DCA; cap at 5%
Income+ Enhance	Fixed-income stabiliser	Hold; reinvest payouts; no new money while above 15%
SRS accounts	Tax-advantaged retirement	Diversify future contributions beyond S&P; 500
AIA policies	Committed long-term 90/10 portfolios	Continue; no top-ups; benchmark annually
REIT+	Singapore property-income satellite	Hold; no priority additions
GE Smart Invest	China equity satellite	Hold; cap dedicated China exposure at 5-7%
Syfe Trade	High-conviction stock selection	Cap at 10% of financial assets; spot only

Recommended weekly DCA redesign

Destination	Weekly amount	Share	Reason
Core Equity100	S\$400/week	80%	Broad, low-maintenance core
Equity Alpha	S\$100/week	20%	Controlled active satellite
Total	S\$500/week	100%	No change to total risk budget

Portfolio guardrails

Risk bucket	Policy	Trigger / control
Growth assets	70-75%	Rebalance if outside 65-80%
Fixed income	15-20%	Keep Income+; do not chase payout yield
Cash-like	8-10%	Absolute floor S\$35k-S\$40k
Active strategies + direct stocks	<=10%	No margin, no options, no leveraged ETFs
Dedicated China exposure	<=5-7%	Include GE, TCOM and look-through overlap
Single direct stock	<=2% household assets	Exception requires written thesis and exit rules

Rebalancing rule

Review quarterly, rebalance annually, or act when a major asset class moves more than 5 percentage points outside its band. Use contributions first. Selling should be the last tool, not the default response to market movement.

ACTIVE INVESTING

Brokerage account: keep it small, intentional and boring

Mandate

The brokerage account is a satellite for high-conviction stock selection. It is not the household retirement engine. At roughly 4.5% of financial assets, it is appropriately sized. You do not need to make it look like an index because Core Equity100 and SRS already provide the core.

Rule	CIO policy
Position sizing	Starter 0.5-1.0% of household financial assets; normal maximum 2.0%
Instrument	Spot shares only. No options, margin or leveraged ETFs.
Funding	Use only capital above the emergency floor and contractual commitments.
Entry	Stage purchases in 2-3 tranches; avoid earnings-event gambling.
Exit	Sell when thesis breaks, valuation becomes extreme, or position breaches risk cap.
Review	Write a one-page thesis: expected return, downside, catalyst, evidence and invalidation.

US tax and estate guardrail

For a non-US citizen and non-US domiciliary, direct US-situated assets can create estate-tax filing exposure when their fair market value at death exceeds US\$60,000. Monitor the combined value of US-domiciled ETFs and direct US shares, not each account separately. Core long-term exposure can generally be routed through Singapore platforms or Irish-domiciled UCITS funds where practical; obtain tax advice before making structural changes. [10]

SRS and CPF priorities

- Use SRS contributions selectively when the tax deduction is valuable and the long lock-up is acceptable. The current citizen/PR cap is S\$15,300 each, subject to the overall personal relief cap. [7]
- Do not automatically max SRS while a second-property goal requires liquidity. Tax relief is not free money if it locks the exact capital you need.
- Use the CPF Retirement Payout Planner annually. 2026 FRS is S\$220,400 and ERS is S\$440,800, but your own age-55 sum will be much higher; current figures are only reference points. [8]
- Avoid irreversible CPF top-ups until the emergency reserve and property decision are settled. Flexibility has value in your 30s.

Current stock decision

Do not feel compelled to buy more stocks now. Your automated global-equity contributions are already doing the heavy lifting. The optimal action in many months will be no trade.

PROPERTY DECISION

Second property: treat it as a leveraged business

S\$700/mo Current property saving	S\$45.5k Projected after 5 years at 4%	S\$100.9k Projected after 10 years at 4%	S\$168.2k Projected after 15 years at 4%
---	--	--	--

Hard truth: the fund is not yet a purchase fund

S\$700/month is a good start, but it accumulates slowly relative to a downpayment, buyer stamp duty, possible ABSD, legal fees, renovation and vacancy reserve. Depending on citizenship and ownership profile, current ABSD can be 20% for a Singapore citizen buying a second residential property and 30% for an SPR buying a second property; residential BSD can reach a 6% marginal rate. Verify the exact buyer profile before making any plan. [11]

Property investment gate - all conditions must pass

Gate	Minimum standard
Emergency reserve	S\$40k remains untouched after completion
Capital	Cash/CPF covers downpayment, all stamp duties, legal/renovation and 12 months of carrying costs
Retirement flow	Annual retirement saving remains at least S\$40,520
Stress test	20% vacancy, 10% rent decline, 2 percentage-point mortgage-rate rise
Return hurdle	Net rental yield plus conservative capital growth beats a diversified portfolio after tax and costs
Concentration	Total property equity does not dominate household net worth or force sale of liquid investments

Recommendation: do not commit to a second property in the next 24 months unless these gates are met. Continue saving, model specific properties as businesses, and compare the equity internal rate of return against the opportunity cost shown above.

PROJECTION FRAMEWORK

Retirement model - deliberately conservative

What the model includes and excludes

Starts with S\$371,513 of financial assets and S\$40,520 of annual retirement contributions. It excludes CPF, home equity, children's funds, future salary growth, future bonuses and property value. That makes the private-portfolio projection conservative, but it is still a scenario analysis - not a forecast.

Input	Assumption	Comment
Current age	35 for both spouses	Derived from AIA illustrations
Starting portfolio	S\$371,513	Current financial assets
Annual retirement contribution	S\$40,520	Cash+ savings plus AIA; property fund excluded
Return scenarios	4% / 6% / 8% nominal	After-fee illustration, not market forecast
Inflation	2.5% per year	Used to express results in today's dollars
Contribution timing	Year-end, constant nominal	No salary growth assumed
Retirement horizons	Ages 55, 60 and 65	20, 25 and 30 years from now
Withdrawal rates	3.0% / 3.25% / 3.5%	More conservative for earlier retirement

Why the withdrawal rates are conservative

Morningstar's 2026 research estimates a 3.9% starting rate for a 30-year horizon with a 90% success target and a balanced portfolio. Earlier retirement requires a longer bridge and more sequence-of-returns protection, so this report uses 3.0% at 55, 3.25% at 60 and 3.5% at 65. [5][6]

Lifestyle targets in today's dollars

Lifestyle	Monthly spend	Needed at 55	Needed at 60	Needed at 65
Lean	S\$5,000	S\$2,000,000	S\$1,846,154	S\$1,714,286
Comfortable	S\$7,000	S\$2,800,000	S\$2,584,615	S\$2,400,000
High-travel	S\$9,000	S\$3,600,000	S\$3,323,077	S\$3,085,714

A S\$7,000/month comfortable target broadly aligns with the MoneySense two-thirds to three-quarters income-replacement guide and your current family lifestyle, while allowing for lower child-related costs but continuing travel and healthcare. [5]

FUTURE VALUE

Projected retirement fund

Retirement age	Cautious 4% real value / income	Base 6% real value / income	Strong 8% real value / income
Age 55	S\$1,233,137 / S\$3,083 mo	S\$1,636,774 / S\$4,092 mo	S\$2,188,359 / S\$5,471 mo
Age 60	S\$1,444,426 / S\$3,912 mo	S\$2,059,175 / S\$5,577 mo	S\$2,970,182 / S\$8,044 mo
Age 65	S\$1,657,885 / S\$4,835 mo	S\$2,544,480 / S\$7,421 mo	S\$3,970,620 / S\$11,581 mo

Interpretation

- Age 55: Base case supports about S\$4,092/month from the private portfolio, and CPF LIFE is generally not yet available. This is not enough for the S\$7,000 target.
- Age 60: Base case supports about S\$5,577/month. Retirement becomes plausible if bonuses continue to be saved, but a five-year bridge to CPF LIFE still matters.
- Age 65: Base case supports about S\$7,421/month before CPF LIFE. This is the strongest and most resilient path.

These are inflation-adjusted portfolio values and first-year withdrawals. Actual outcomes will vary with returns, fees, taxes, contribution changes, retirement spending flexibility and sequence risk.

READINESS

When can you realistically retire?

Retire at	S\$7k target fund	Required annual saving	Current annual saving	Verdict
Age 55	S\$2,800,000	S\$92,336	S\$40,520	Increase by S\$51,816/year
Age 60	S\$2,584,615	S\$58,275	S\$40,520	Increase by S\$17,755/year
Age 65	S\$2,400,000	S\$36,687	S\$40,520	Current plan exceeds requirement

CIO retirement verdict

- Age 55: not funded at the current saving rate. It requires roughly S\$92k/year toward retirement, a lower spending target, or meaningful business/property income.
- Age 60: plausible. The model requires about S\$58k/year; consistently investing an additional S\$20k of bonuses would put the base scenario slightly above the target.
- Age 65: robust. The current contribution rate exceeds the modelled requirement before CPF, giving you room for shocks or a better lifestyle.

A useful rule: every S\$1,000/month of reliable CPF LIFE or other pension income reduces the private portfolio requirement by roughly S\$343,000 at a 3.5% withdrawal rate. Do not count CPF twice; model it separately once current statements are available.

EXECUTION

Action plan

Timing	Area	Action
Next 30 days	Liquidity	Place S\$10k-S\$15k in same-day bank cash; target S\$35k-S\$40k combined emergency reserve.
Next 30 days	Nest	Record full AIA accruals; tag internal transfers so DCA is not counted as fresh saving.
Next 30 days	DCA	Change weekly allocation to S\$400 Core Equity100 / S\$100 Equity Alpha.
Next 60 days	Protection	Audit death/TPD, critical illness and disability-income coverage for both spouses.
Next 90 days	Estate	Complete or review wills, guardians, CPF nominations and LPAs.
Next 90 days	Policy	Write and adopt the allocation bands and brokerage rules in this report.
Next 12 months	AIA	No top-ups. Compare net performance and internal fund options against benchmark annually.
Next 12 months	SRS	Decide contribution based on marginal tax benefit and liquidity; diversify future SRS beyond S&P; 500.
Next 24 months	Property	Do not buy until every property gate passes and the emergency reserve survives completion.
Each year	Rebalance	Use new contributions first; act only if a major asset class is outside its band by >5 points.
Age 45-50	Retirement bridge	Begin building 3-5 years of lower-volatility spending assets if targeting retirement before 65.
Age 55+	Decumulation	Coordinate private portfolio, SRS withdrawal window, CPF LIFE and mortgage status.

What not to do

- Do not divest Income+ merely to increase expected return.
- Do not buy another ILP or endowment because it is marketed as disciplined saving.
- Do not use options, margin or leveraged ETFs in the household portfolio.
- Do not count gross distributions as investment return.
- Do not buy a second property using emergency capital or by reducing retirement saving below S\$40.5k/year.
- Do not judge Equity Alpha or any stock strategy on one good year.

Priority order for every bonus

1) Refill bank and Cash+ emergency floor. 2) Reserve the next AIA premiums. 3) Fund near-term family goals. 4) Decide SRS tax contribution. 5) Add to Core Equity100. 6) Only then fund direct stocks or the property option.

INSURANCE AND ESTATE

Protect the plan, not just the portfolio

With two children, a mortgage and dual incomes, the most expensive risk is not a stock-market fall. It is the permanent loss of one income or decision-making capacity.

Coverage benchmark	Indicative amount	Basis
Peter - death / TPD benchmark	~\$1,170,000	9x annual income rule of thumb
Abigail - death / TPD benchmark	~\$810,000	9x annual income rule of thumb
Peter - critical illness benchmark	~\$520,000	4x annual income rule of thumb
Abigail - critical illness benchmark	~\$360,000	4x annual income rule of thumb

These are MoneySense planning benchmarks, not a substitute for a needs analysis. Subtract available liquid assets and existing coverage, then add mortgage repayment, child-rearing, education, care for parents and income-replacement needs. Protection spending should generally stay within 15% of income. [4]

Item	Current status	Required action
Hospitalisation	Known to exist	Confirm riders, deductibles and affordability after retirement
Death / TPD term cover	Unknown	Obtain current sums assured and expiry ages
Critical illness	Known broadly	Confirm amount, definitions, early-stage cover and duplication
Disability income	Unknown	High priority for two salary-dependent parents
Mortgage protection	Unknown	Confirm whether loan is fully covered on either death
Wills and guardians	Unknown	Name guardians and testamentary arrangements for both children
CPF nominations	Must be separate from will	Review after marriage and children; CPF is not covered by a will
LPA	Unknown	Appoint donees for personal welfare and property/affairs

Estate deadline

Complete the estate and incapacity package within 90 days. CPF nomination directs CPF savings outside the will, and an LPA allows chosen donees to act if mental capacity is lost. [12]

PRODUCT RECOMMENDATION

Turn Nest into the household CIO dashboard

You have already solved the hardest behavioural problem: disciplined data capture and automation. The next step is to make Nest distinguish cash flow, investment performance, risk and goals correctly.

Feature	What it should do
External contribution flag	Separate new savings from transfers between Cash+, Core and Alpha
Household XIRR	Money-weighted return by account and consolidated portfolio
Time-weighted return	Compare managers and strategies without cash-flow distortion
Look-through exposure	Aggregate region, sector and top-stock overlap across every wrapper
Fee ledger	Platform, fund, policy, transaction and FX fees in dollars and basis points
Liquidity ladder	Same-day, 1-3 day, market-exposed liquid, SRS-restricted, policy-restricted
Goal metadata	Target date, target amount, risk limit and funding source for every pot
Retirement engine	Ages 55/60/65, inflation, CPF, SRS, property and sequence-risk scenarios
Risk alerts	Cash 10%; China >7%; asset band breach >5 points
Annual family report	Freeze a year-end snapshot with net worth, contributions, XIRR and decisions

Most important data-model rule

A transfer is not income, saving or investment return. Cash+ to Core, dividend reinvestment, AIA unit allocation and account-to-account movements must be tagged separately. Without that distinction, savings rates and performance will be overstated.

Suggested CIO dashboard tiles

- Liquid net worth and restricted net worth
- Current vs target asset allocation
- Rolling 12-month external contributions
- Household XIRR vs blended benchmark
- Emergency-floor headroom
- Retirement target probability / gap
- Property-goal capital and stress-test result
- Insurance and estate completion status

DECISION SUMMARY

Final CIO stance

Your strategic position

You are on track for a strong conventional retirement and potentially an age-60 retirement, provided you preserve the current saving engine and avoid a badly structured property purchase. Age 55 is an aspirational target, not yet a funded one. The solution is not more speculative return; it is higher sustained contributions, bonus discipline, lower fees and a clear bridge plan.

Holding / decision	CIO call	Reason
Income+	KEEP	Correct size for portfolio stability
Core Equity100	KEEP / PRIORITISE	Primary destination for long-term equity money
Cash+ Flexi	KEEP WITH FLOOR	Staging plus second-line emergency liquidity
Equity Alpha	REDUCE FLOW	S\$100/week until it earns a larger role
AIA policies	CONTINUE / NO TOP-UPS	Committed; monitor benchmark and internal options
SRS S&P; 500	KEEP / DIVERSIFY FUTURE	Wrapper useful; underlying too US-heavy
REIT+	HOLD	Enough property-related listed exposure
GE China	HOLD / NO ADD	Dedicated China satellite already sufficient
Syfe Trade	HOLD AS SATELLITE	Cap at 10%; spot only
Second property	WAIT	Proceed only after all gates pass

The single highest-return action

Protect the existing system from disruption. A missed market rally is recoverable. A liquidity crisis, uninsured loss of income, forced policy or stock sale, or over-leveraged property purchase is not.

Recommended next review: January 2027, using updated CPF balances, policy statements, insurance sums assured, 2026 tax data and a full year of Nest transaction classifications.

APPENDIX

Methodology, sources and limitations

Methodology. Values are based on user-provided screenshots and documents. Asset-class look-through treats both AIA Elite Adventurous holdings as 90% equity / 10% fixed income. Returns are deterministic scenarios, not probability forecasts. Contributions occur at year-end and remain constant in nominal dollars. Real values use 2.5% inflation. Withdrawal rates are planning heuristics and not guarantees.

Not included in retirement projections. CPF, home equity, children's education funds, future pay rises, future bonuses, taxes, transaction costs, property value/rent, and changes in household spending. Their exclusion is conservative for assets and optimistic where future liabilities or taxes are not modelled.
